

Methylation-expression correlation: 6-angle sensitivity on 57 exposed TFs
 Row 1: Δ methylation $\times$ LFC $\rightarrow$ no signal | Row 2: absolute T1 methylation $\times$ LFC $\rightarrow$ signal (4mC, ± 200 -500 bp) | Row 3: same, region-controlled (signal halved but T2vT1@293bp survives)
 Open ring = $p < 0.05$
