

H35: Comprehensive Summary - Exposed TF Functional Prediction

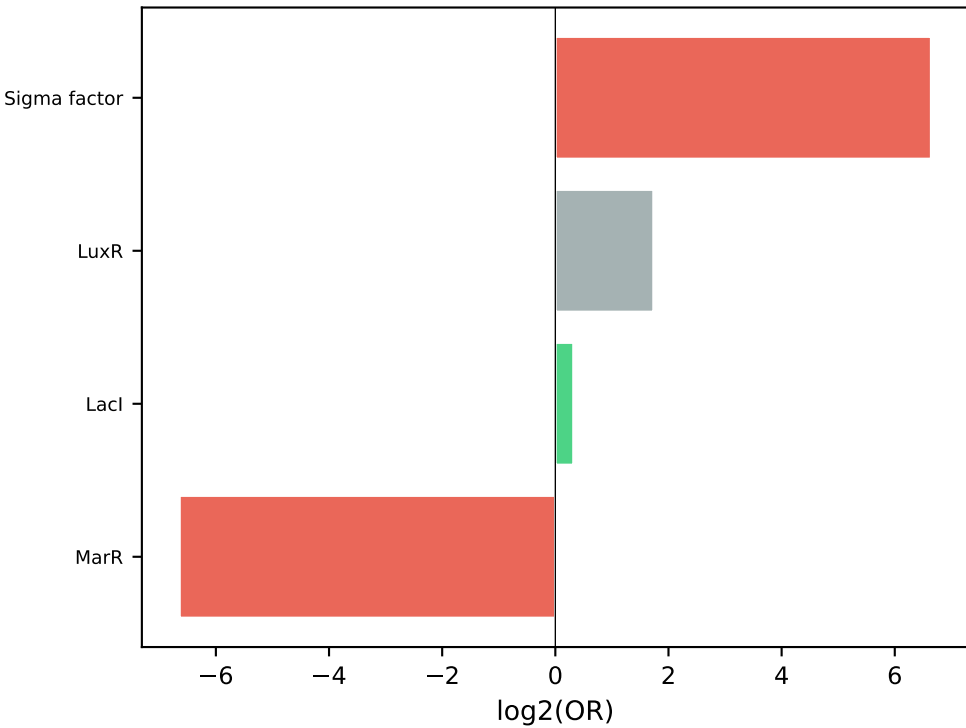

A. TF Family by Bloc

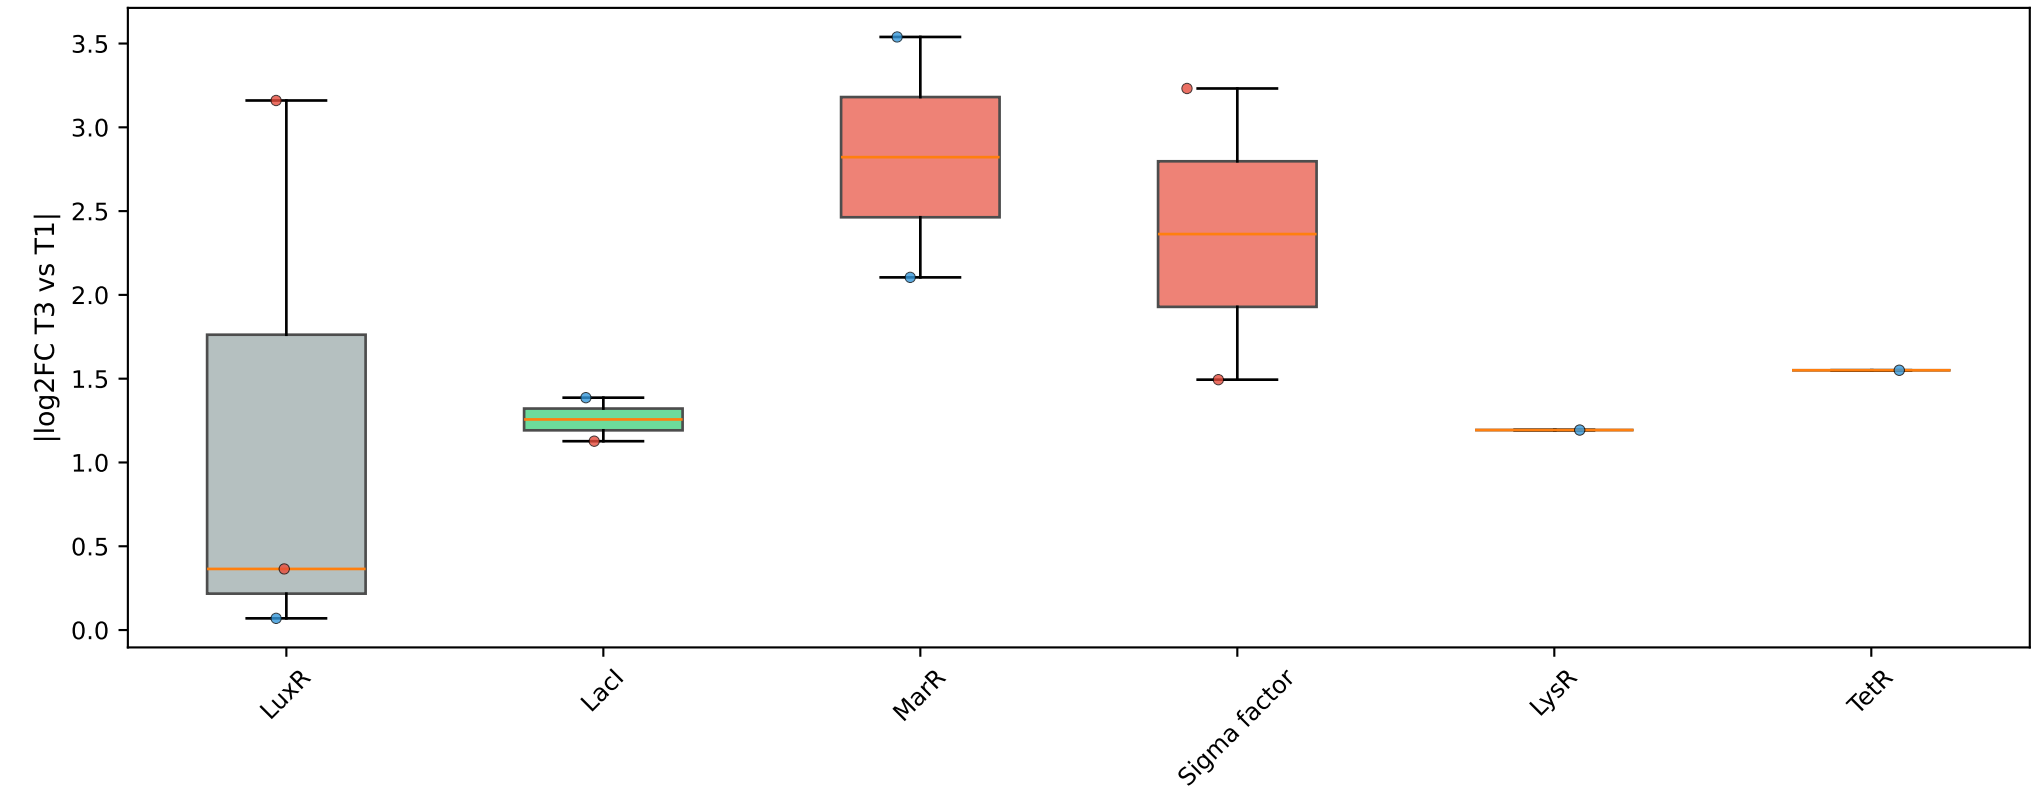

B. Functional Categories

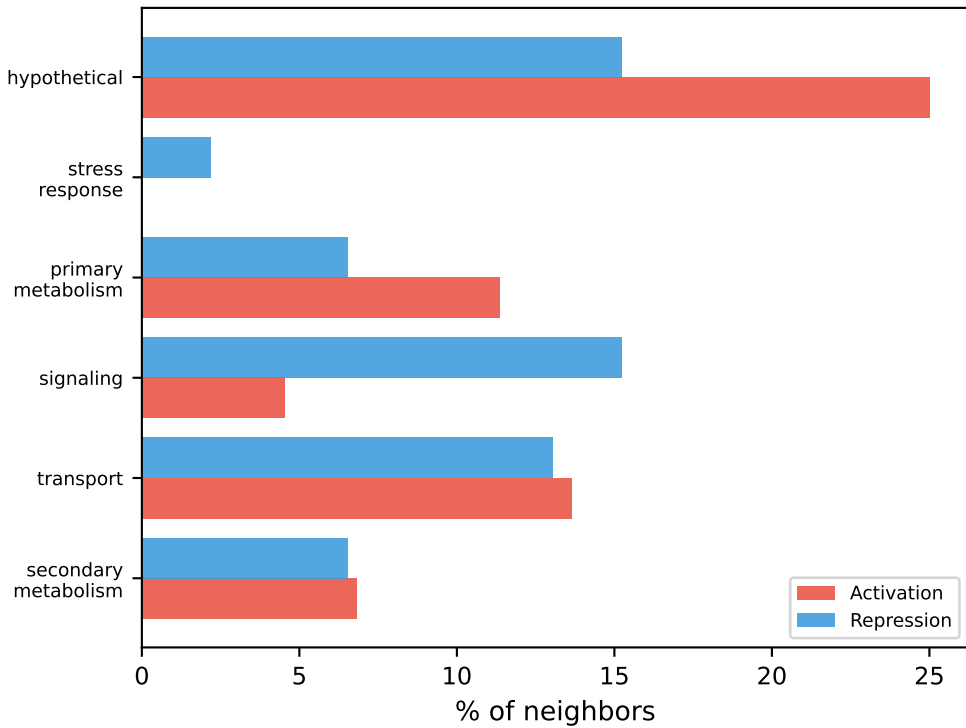

C. Family Enrichment (Fisher)

D. Expression Response by TF Family (KW p=0.2639)

E. Neighbor Functions

H35 SUMMARY: Functional Prediction of 62 Exposed Transcription Factors

ACTIVATION BLOC (35 genes, Modules 1-3): Enriched for Signal transduction (TCS) and Stress/development (sigma factors, WhiB). Predicted activated processes: Morphological differentiation (RamR, sigma factors), TCS cascades, secondary metabolite regulation (TcrA, NsdB).

REPRESSION BLOC (26 genes, Module 4): Enriched for Metabolic regulators (GntR, IclR, LacI, LysR) and Defense/resistance (TetR, ArsR). Predicted repressed processes: Primary metabolism shutdown, antibiotic efflux/defense downregulation, DNA replication/repair cessation, fatty acid biosynthesis (FasR), nitrogen assimilation (P-II).

MODEL: The two blocs implement a coordinated developmental switch -- vegetative growth programs are repressed while developmental/stress/signaling programs are activated, consistent with the *S. coelicolor* life cycle transition.
